

R. M. JONES - SEPTEMBER 2017

The Start of the Sheep Year

Flock health and productivity ~ Maximising returns starts at tugging

“You only get one chance a year to raise a lamb crop and make a profit - you have to get it right first time”.

Autumn is the start of the sheep year. How you manage your flock over the next couple of months will be key to a successful lambing and a profitable lamb crop.

Ewe body condition has a significant affect on the number of ewes that become pregnant and eventually carry their lambs through to lambing time.

Grass quality and quantity is now declining so your sheep will need supplementing to keep Condition Score at 3.5 (for lowland ewes).

Preparation for Tugging

Get your Ewes fit - We have Tup2Ewe buckets & Crystalyx. They are convenient, labour saving and do a good job!

Boost Cobalt, Selenium and Iodine levels with **Downland Essential Sheep bolus-releases trace elements every day for 6 months.**

Trace elements and Vitamins also available with Ovigain drench.

If you grow cereals and want to feed them we have protein balancers to provide a balanced ration.

Treat and Quarantine Any New Stock - for the sake of your land

Don't bring resistant worms and scab onto your farm - because the resistant worms will infest not only your existing stock but also your pastures for many years to come.

Talk to us about the best option & if Zolvix can fit into your system

Clear out Scab & Worms

Talk to us about the best treatments as not all Ewes will need a straight wormer at this time of year

New Agronomist at R M Jones

We have a new agronomist Henry Monkley joining our team

Henry grew up on the family farm in North Hereford & graduated from Harper Adams with a BSc (Hons) in Agriculture with Crop Management

As part of his degree he worked at Rothamsted Research

For the past 2 years Henry has been working as an agronomist & has passed his BASIS

We look forward to working with him

R M Jones is changing Bank

We have been with the same bank since the business started -nearly 60 years ago

But our bank have decided to close our local branch in Hay and at the same time increase our bank charges by over 200%!

So we are moving—

If you pay by BACS our new account details are shown on your current statement.

Save on Feeding Costs this Winter

Our Superstock range of protein blends gives you a wide-choice of specifications to match your forages and cereals this winter. Suitable for addition to home-mixes, top-dressing on forage or addition to a TMR fed from a feeder wagon. They are packed in 25-kg bags for accurate addition and can be purchased when required, easing the cash-flow. Our Superstock range of protein blends contain a mix of urea and natural protein.

Cattle Housing Dose

Zermex Pour On is the most flexible product to use this autumn.

It is broad spectrum, controlling all major stomach worms, lungworm and lice.

Zermex is also very flexible - you can dose your cattle at grass, and house them within 5 weeks without the need to dose again. So making the most of your grass & reducing your feeding bills.

Zermex is also kind to dung beetles - this means they can still do their job of recycling the dung. This reduces the incidence of "mole hills" typically seen after dosing with Ivermectin pour ons.

Arable News

Autumn Cereal Herbicides

With fewer effective contact herbicide options it is essential that we are prepared to tackle the problem early. There are increasing brome and blackgrass issues in our area but even benign looking annual meadow grass can reduce yields significantly and needs to be controlled in the autumn. As touched on in last months newsletter control should have started with cultural techniques to reduce the initial burden. A word of caution however, WRAG (Weed Resistance Action Group) are keen to try to prevent glyphosate resistance, as we all are, and they state that more than one application of glyphosate pre-drilling could significantly increase the risk of resistance developing.

The work carried out at our black grass trial site in Stow Longa highlights these key points.

- Make the primary cultivation soon after harvest
- Don't keep cultivating or spraying to chit more blackgrass on high level sites - thousands of seeds in the seedbank so leave them there!
- Leave 6 weeks between the main cultivation and drilling
- Glyphosate with a decent product and rate close to drilling
- When you drill - drill, don't cultivate!
- Consolidate the seedbed if possible and use a sensible residual programme
- Stand back and admire the results of the above in June 2018!

Pre-emergence chemistry is extremely important and is vital for early grass weed control particularly in winter barley for brome grass where it is the only option available and still unlikely to give full control. Pre-em's are generally safer to the crop, reduce the reliance on more resistant prone contact herbicides and any survivors are likely to be weak and more sensitive to follow up treatments.

Movon is still performing the best with 5% better control of difficult grassweeds such as blackgrass and ryegrass compared to other options.

Autumn Oilseed Rape Herbicides

Similar to the cereal situation the portfolio is being reduced, Katamaran Turbo has the most broad spectrum range of control covering all of the main weed species. It may also be necessary to use a clomazone based product pre emergence if cleavers or hedge mustard are likely to be a particular problem.

As always speak to your R.M. Jones agronomist for the best advise.
